Clean Python Environment Guide (Conda / venv)

This short guide helps you create a truly clean Python environment without global package interference.

Steps:

1. Create clean conda environment: conda create -n myenv python=3.12 --no-default-packages -y
2. Activate environment: conda activate myenv
3. Verify clean state: python -m pip freeze
4. Disable global packages (important): setx PYTHONNOUSERSITE 1
5. Restart terminal and activate again
6. Always install packages using: python -m pip install

Expected result: pip freeze should only show pip, setuptools, and wheel.
